

ABSTRACT

A device for gluing together two disc halves which are each provided with a central hole, to produce a disc, for example an optical data carrier, such as a DVD, comprises a rotatable carrier provided with a mandrel on which the disc halves can be accommodated, in such a manner that the mandrel fits through their central holes. Furthermore, there is a light radiation source which emits a light beam which can be displaced in the radial direction with respect to the mandrel.
